## DESCRIPTION

The RS2166 is a bidirectional 1-channel single-pole single-throw (SPST) analog switch, which is designed to operate from 1.8V to 5.5V.

The RS2166 device can handle both analog and digital signals. It features bandwidth(300MHz) and low on-resistance (4.5Ω TYP).

Each switch section has its own enable-input control (SEL). A high-level voltage applied to SEL turns on the associated switch section.

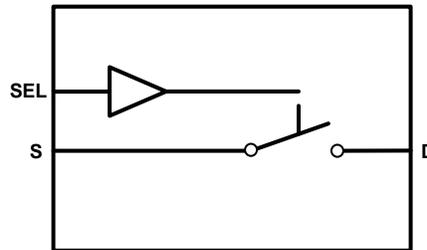

Applications include signal gating, chopping, modulation or demodulation (modem), and signal multiplexing for analog-to-digital and digital-to-analog conversion systems.

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

(2) All voltages are with respect to ground, unless otherwise specified.

(3) The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

(4) This value is limited to 5.5 V maximum.

### TYPICAL APPLICATION

The RS2166 can be used in any situation where an SPST switch would be used and a solid-state, voltage-controlled version is preferred. The RS2166 allows on and off control of analog and digital signals with a digital control signal. All input signals should remain between 0V and  $V_{CC}$  for optimal operation.
